

The goal is simple: a local store owner or marketer can turn neighborhood photos, short clips, and rough campaign ideas into a polished short-form wellness video.

First, I start with the campaign setup. I can enter the business name, location, neighborhood context, and the overall campaign goal. This helps the app understand that we're not creating a generic ad. We're creating something specific to this Pure Green location and the local customer routine.

Next, I choose the audience. For example, I can target gym goers, runners, yoga and Pilates customers, families, or active adults. Then I choose the product focus, such as smoothies, acai bowls, cold-pressed juices, fruits, vegetables, or superfoods.

The important part is the narration workflow. I can type rough thoughts in plain language, like: "after yoga, people should feel like Pure Green is the fresh local stop, upbeat, healthy, not too salesy." Then I click **Polish with ChatGPT**. The app turns that rough intent into campaign-ready narration. I can preview the polished copy, use it as-is, or edit it before generating the campaign.

After that, I upload photos or short videos from the local store or neighborhood. If I don't upload enough media, the app can use the backup campaign folder to fill in supporting assets.

When I click **Generate campaign video**, the app runs the production pipeline. It creates the campaign, uploads or selects media, analyzes the assets, generates a storyboard, checks the copy for safe wellness claims, creates narration, and renders a preview.

On the right side, I can track each step in the pipeline. The generated video preview is also resizable, so I can expand it and review the steps and output more comfortably.

The final result includes a localized video preview with selected visuals, captions, narration, music direction, compliance-safe wording, and a download-ready campaign asset.

What this demonstrates is not just video generation. It shows an end-to-end marketing workflow: rough human intent goes in, AI helps polish the message, the system organizes creative assets, checks for brand and wellness safety, and produces a localized campaign that a store can actually use.
